Package 'vanquish'

October 12, 2022

Title Variant Quality Investigation Helper

Version 1.0.0

Description Imports Variant Calling Format file into R. It can detect whether a sample contains contaminant from the same species. In the first stage of the approach, a change-point detection method is used to identify copy number variations for filtering. Next, features are extracted from the data for a support vector machine model. For log-likelihood calculation, the deviation parameter is estimated by maximum likelihood method. Using a radial basis function kernel support vector machine, the contamination of a sample can be detected.

Depends R (>= 3.4.0)

Imports changepoint, e1071, ggplot2, stats, VGAM

License GPL-2

Encoding UTF-8

LazyData true

RoxygenNote 6.0.1

NeedsCompilation no

`config_df` *Default parameters of config.*

Description

A dataframe containing default parameters.

Usage

```
config_df
```

Format

A data frame with 12 variables:

`threshold` Threshold for allele frequency

`skew` Skewness for allele frequency

`lower` Lower bound for allele frequency region

`upper` Upper bound for allele frequency region

`ldpthred` Threshold to determine low depth

`hom_mle` Hom MLE of p in Beta-Binomial model

`het_mle` Het MLE of p in Beta-Binomial model

`Hom_thred` Threshold between hom and high

`High_thred` Threshold between high and het

`Het_thred` Threshold between het and low

`hom_rho` Hom MLE of rho in Beta-Binomial model

`het_rho` Het MLE of rho in Beta-Binomial model

Source

Created by Tao Jiang

`defcon` *DEtection of Frequency CONtamination*

Description

Detects whether a sample is contaminated another sample of its same species. The input file should be in vcf format.

Usage

```
defcon(file, rmCNV = FALSE, cnvobj = NULL, config = NULL,
  class_model = NULL, regression_model = NULL)
```

Arguments

`file`	VCF input object
`rmCNV`	Remove CNV regions, default is FALSE
`cnvobj`	CNV object, default is NULL
`config`	config information of parameters. A default set is generated as part of the model and is included in a model object, which contains
`class_model`	An SVM classification model
`regression_model`	An SVM regression model

Value

A list containing (1) stat: a data frame with all statistics for contamination estimation; (2) result: contamination estimation (Class = 0, pure; Class = 1, contaminated)

Examples

```
data(vcf_example)
result <- defcon(file = vcf_example)
```

generate_feature *Feature Generation for Contamination Detection Model*

Description

Generates features from each pair of input VCF objects for training contamination detection model.

Usage

```
generate_feature(file, hom_p = 0.999, het_p = 0.5, hom_rho = 0.005,
  het_rho = 0.1, mixture, homcut = 0.99, highcut = 0.7, hetcut = 0.3)
```

Arguments

file	VCF input object
hom_p	The initial value for p in Homozygous Beta-Binomial model, default is 0.999
het_p	The initial value for p in Heterozygous Beta-Binomial model, default is 0.5
hom_rho	The initial value for rho in Homozygous Beta-Binomial model, default is 0.005
het_rho	The initial value for rho in Heterozygous Beta-Binomial model, default is 0.1
mixture	A vector of whether the sample is contaminated: 0 for pure; 1 for contaminated
homcut	Cutoff allele frequency value between hom and high, default is 0.99
highcut	Cutoff allele frequency value between high and het, default is 0.7
hetcut	Cutoff allele frequency value between het and low, default is 0.3

Value

A data frame with all features for training model of contamination detection

getAlt2 *Second alternative allele percentage*

Description

Second alternative allele percentage

Usage

```
getAlt2(f)
```

Arguments

f	Input raw file

Value

Percent of the second alternative allele

getAnnoRate *Annotation rate*

Description

Annotation rate

Usage

```
getAnnoRate(f)
```

Arguments

f	Input raw file

Value

Percentage of annotation locus

getAvgLL *Calculate average log-likelihood*

Description

Calculate average log-likelihood

Usage

```
getAvgLL(df, hom_mle, het_mle, hom_rho, het_rho)
```

Arguments

df	Input modified file
hom_mle	Hom MLE of p in Beta-Binomial model, default is 0.9981416 from NA12878_1_L5
het_mle	Het MLE of p in Beta-Binomial model, default is 0.4737897 from NA12878_1_L5
hom_rho	Hom MLE of rho in Beta-Binomial model, default is 0.04570275 from NA12878_1_L5
het_rho	Het MLE of rho in Beta-Binomial model, default is 0.02224098 from NA12878_1_L5

Value

meanLL

`getLowDepth` *Low depth percentage*

Description

Low depth percentage

Usage

```
getLowDepth(f, ldpthred)
```

Arguments

`f`	Input raw file
`ldpthred`	Threshold to determine low depth, default is 20

Value

Percentage of low depth

`getRatio` *Get the ratio of allele frequencies with a region*

Description

Get the ratio of allele frequencies with a region

Usage

```
getRatio(subdf, lower, upper)
```

Arguments

`subdf`	Dataframe with calculated statistics
`lower`	Lower bound for allele frequency region
`upper`	Upper bound for allele frequency region

Value

Ratio of allele frequencies with a region

getSkewness *Get absolute value of skewness*

Description

Get absolute value of skewness

Usage

```
getSkewness(subdf)
```

Arguments

subdf	Input dataframe

Value

Absolute value of skewness

getSNVRate *SNV percentage*

Description

SNV percentage

Usage

```
getSNVRate(df)
```

Arguments

df	Input raw file

Value

Percentage of SNV

getVar *Calculate zygosity variable*

Description

Calculate zygosity variable

Usage

```
getVar(df, state, hom_mle, het_mle)
```

Arguments

df	Input modified file
state	Zygosity state
hom_mle	MLE in hom model
het_mle	MLE in het model

Value

Zygosity variable

locateFile *Check input filename*

Description

Check input filename

Usage

```
locateFile(fn, extension)
```

Arguments

fn	Exact full file name of input file, including directory
extension	Expected input file extension: vcf & txt

Value

Valid directory

negll *Negative Log Likelihood*

Description

Calculates negative log likelihood for beta binomial distribution.

Usage

```
negll(x, size, prob, rho)
```

Arguments

x	Depth of alternative allele
size	Total depth
prob	Theoretical probability for heterozygous is 0.5, for homozygous is 0.999
rho	Rho parameter of Beta-Binomial distribution of alternative allele

readGATK *Read in input vcf data in GATK format for Contamination detection*

Description

Read in input vcf data in GATK format for Contamination detection

Usage

```
readGATK(dr, dbOnly, depCut, thred, content, extnum, keepall)
```

Arguments

dr	A valid input object
dbOnly	Use dbSNP as filter, default is FALSE, passed from read_vcf
depCut	Use a threshold for min depth , default is False
thred	Threshold for min depth, default is 20
content	Column names in VCF files
extnum	The column number or numbers to be extracted from vcf, default is 10; 0 for not extracting any columns
keepall	Keep unextracted column in output, default is TRUE, passed from read_vcf

Value

Dataframe from VCF file

readStrelka *Read in input vcf data in strelka2 format for Contamination detection*

Description

Read in input vcf data in strelka2 format for Contamination detection

Usage

```
readStrelka(dr, dbOnly, depCut, thred, content, extnum, keepall)
```

Arguments

dr	A valid input object
dbOnly	Use dbSNP as filter, default is FALSE, passed from read_vcf
depCut	Use a threshold for min depth , default is False
thred	Threshold for min depth, default is 20
content	Column names in VCF files
extnum	The column number or numbers to be extracted from vcf, default is 10; 0 for not extracting any columns
keepall	Keep unextracted column in output, default is TRUE, passed from read_vcf

Value

Dataframe from VCF file

readVarDict *Read in input vcf data in VarDict format for Contamination detection*

Description

Read in input vcf data in VarDict format for Contamination detection

Usage

```
readVarDict(dr, dbOnly, depCut, thred, content, extnum, keepall)
```

Arguments

dr	A valid input object
dbOnly	Use dbSNP as filter, default is FALSE, passed from read_vcf
depCut	Use a threshold for min depth , default is False
thred	Threshold for min depth, default is 20
content	Column names in VCF files
extnum	The column number to be extracted from vcf, default is 10; 0 for not extracting any column
keepall	Keep unextracted column in output, default is TRUE, passed from read_vcf

Value

Dataframe from VCF file

---

readVarPROWL *Read in input vcf data in VarPROWL format*

Description

Read in input vcf data in VarPROWL format

Usage

```
readVarPROWL(dr, dbOnly, depCut, thred, content, extnum, keepall)
```

Arguments

dr	A valid input object
dbOnly	Use dbSNP as filter, default is FALSE, passed from read_vcf
depCut	Use a threshold for min depth , default is False
thred	Threshold for min depth, default is 20
content	Column names in VCF files
extnum	The column number or numbers to be extracted from vcf, default is 10; 0 for not extracting any columns
keepall	Keep unextracted column in output, default is TRUE, passed from read_vcf

Value

vcf Dataframe from VCF file

read_vcf *VCF Data Input*

Description

Reads a file in vcf or vcf.gz file and creates a list containing Content, Meta, VCF and file_sample_name

Usage

```
read_vcf(fn, vcffor, dbOnly = FALSE, depCut = FALSE, thred = 20,
  metaline = 200, extnum = 10, keepall = TRUE, filter = FALSE)
```

Arguments

fn	Input vcf file name
vcffor	Input vcf data format: 1) GATK; 2) VarPROWL; 3) VarDict; 4) strelka2
dbOnly	Use dbSNP as filter, default is FALSE
depCut	Use a threshold for min depth , default is False
thred	Threshold for min depth, default is 20
metaline	Number of head lines to read in (better to be large enough), the lines will be checked if they contain meta information, default is 200
extnum	The column number to be extracted from vcf, default is 10; 0 for not extracting any column; extnum should be between 10 and total column number
keepall	Keep unextracted column in output, default is TRUE
filter	Whether to select "PASS" variants for analyses if they contain unfiltered variants, default is FALSE

Value

A list containing (1) Content: a vector showing what is contained; (2) Meta: a data frame containing meta-information of the file; (3) VCF: a data frame, the main part of VCF file; (4) file_sample_name: the file name and sample name, in case when multiple samples exist in one file, file and sample names might be different

Examples

```
file.name <- system.file("extdata", "example.vcf.gz", package = "vanquish")
example <- read_vcf(fn=file.name, vcffor="VarPROWL")
```

rho_est *Estimate Rho for Alternative Allele Frequency*

Description

Estimates Rho parameter in beta binomial distribution for alternative allele frequency

Usage

```
rho_est(vl)
```

Arguments

vl	A list of vcf objects from read_vcf function.

Value

A list containing (1) het_rho: Rho parameter of heterozygous location; (2) hom_rho: Rho parameter homozygous location;

Examples

```
data("vcf_example")
vcf_list <- list()
vcf_list[[1]] <- vcf_example$VCF
res <- rho_est(vl = vcf_list)
res$het_rho[[1]]$par
res$hom_rho[[1]]$par
```

rmChangePoint *Remove CNV regions within VCF files by change point method*

Description

Remove CNV regions within VCF files by change point method

Usage

```
rmChangePoint(vcf, threshold, skew, lower, upper)
```

Arguments

vcf	Input VCF files
threshold	Threshold for allele frequency
skew	Skewness for allele frequency
lower	Lower bound for allele frequency region
upper	Upper bound for allele frequency region

Value

VCF object without change point region

`rmCNVinVCF` *Remove CNV regions within VCF files given cnv file*

Description

Remove CNV regions within VCF files given cnv file

Usage

```
rmCNVinVCF(vcf, cnvobj)
```

Arguments

`vcf`	Input VCF files
`cnvobj`	cnv object

Value

VCF object without change point region

`summary_vcf` *VCF Data Summary*

Description

Summarizes allele frequency information in scatter and density plots

Usage

```
summary_vcf(vcf, ZG = NULL, CHR = NULL)
```

Arguments

`vcf`	VCF object from read_vcf function
`ZG`	zygosity: (1) null, for both het and hom, default; (2) het; (3) hom
`CHR`	chromosome number: (1) null, all chromosome, default; (2) any specific number

Value

A list containing (1) scatter: allele frequency scatter plot; (2) density: allele frequency density plot

Examples

```
data("vcf_example")
tmp <- summary_vcf(vcf = vcf_example, ZG = 'het', CHR = c(1,2))
plot(tmp$scatter)
plot(tmp$density)
```

`svm_class_model` *Default svm classification model.*

Description

An svm object containing default svm classification model.

Usage

```
svm_class_model
```

Format

An svm object:

Source

Created by Tao Jiang

`svm_regression_model` *Default svm regression model.*

Description

An svm object containing default svm regression model.

Usage

```
svm_regression_model
```

Format

An svm object:

Source

Created by Tao Jiang

train_ct *Train Contamination Detection Model*

Description

Trains two SVM models (classification and regression) to detects whether a sample is contaminated another sample of its same species.

Usage

```
train_ct(feature)
```

Arguments

feature	Feature list objects from generate_feature()

Value

A list contains two trained svm models: regression & classification

update_vcf *Remove CNV regions within VCF files*

Description

Remove CNV regions within VCF files

Usage

```
update_vcf(rmCNV = FALSE, vcf, cnvobj = NULL, threshold = 0.1,
  skew = 0.5, lower = 0.45, upper = 0.55)
```

Arguments

rmCNV	Remove CNV regions, default is FALSE
vcf	Input VCF files
cnvobj	cnv object, default is NULL
threshold	Threshold for allele frequency, default is 0.1
skew	Skewness for allele frequency, default is 0.5
lower	Lower bound for allele frequency region, default is 0.45
upper	Upper bound for allele frequency region, default is 0.55

Value

VCF file without CNV region

vcf_example *VCF example file.*

Description

An example containing a list of 4 data frames.

Usage

```
vcf_example
```

Format

A list of 4 data frames:
